
979 USCRN wetting events, 107 stations, storms 17 Jun–31 Oct 2026. Fleet = actual Sentinel-1C/1D + NISAR acquisition times (OBSERVED). ARMO = orbit-model passes (SIMULATED), 8 initial phases, access corridor 25–45° off-nadir assumed fully imaged (see swath sensitivity). A look is an opportunity, not a detection. ARMO D newly looks at 293 events on average (range 284–298 over phases). CIs: station-cluster bootstrap of the paired gain (2,000 draws); 'stations + phase' also draws one random phase per replicate.
