
SIMULATED, HYPOTHETICAL. Design D (2 satellites, 620 km dawn–dusk, right-looking 25–45° access corridor ≈ 362 km). A narrower usable strip W is imaged inside the corridor: 'fixed' = one central strip every pass; 'cycled' = overlapping strips spanning the corridor, stepped every revolution. Same 979 events (107 stations, 17 Jun–31 Oct 2026), real Sentinel-1 + NISAR looks as baseline, 8 orbital phases. Not an imaging-mode design: radiometry, polarimetry, 100–200 m product quality, power and downlink for any W are UNVALIDATED. Data volume assumed ∝ W at fixed pixel spacing.
